

Airfoil: fitted interaction contributions

Selected 2-pair model: 49.2% lower test MSE than its additive control

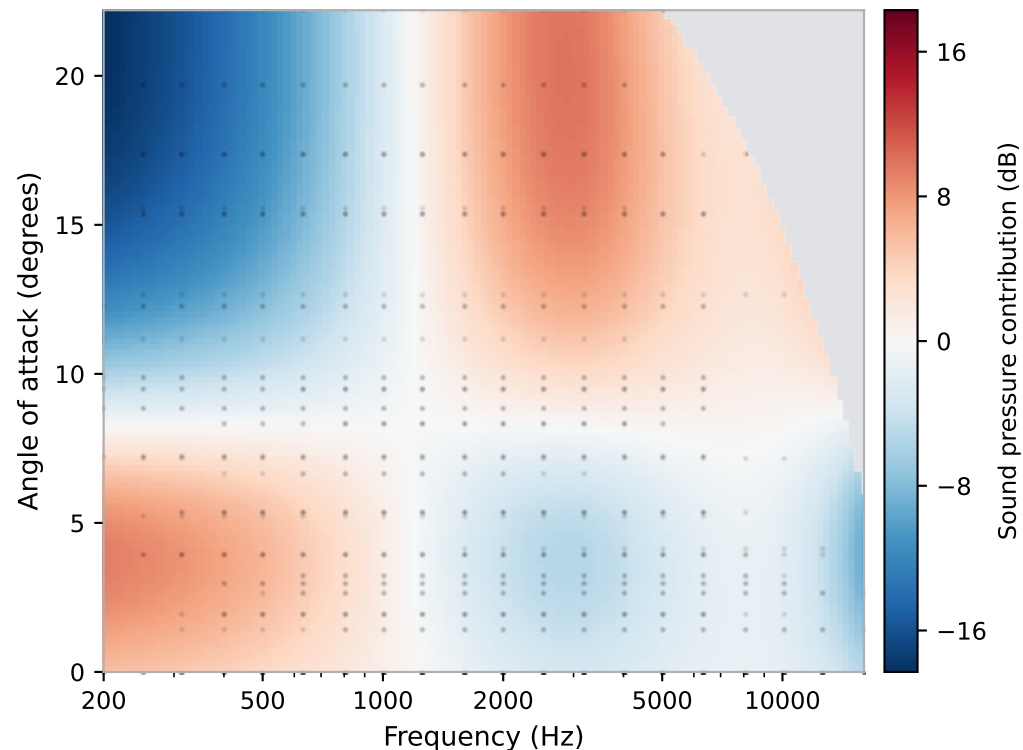

A. Frequency $\times$

Boundary-layer displacement thickness

B. Frequency $\times$

Angle of attack

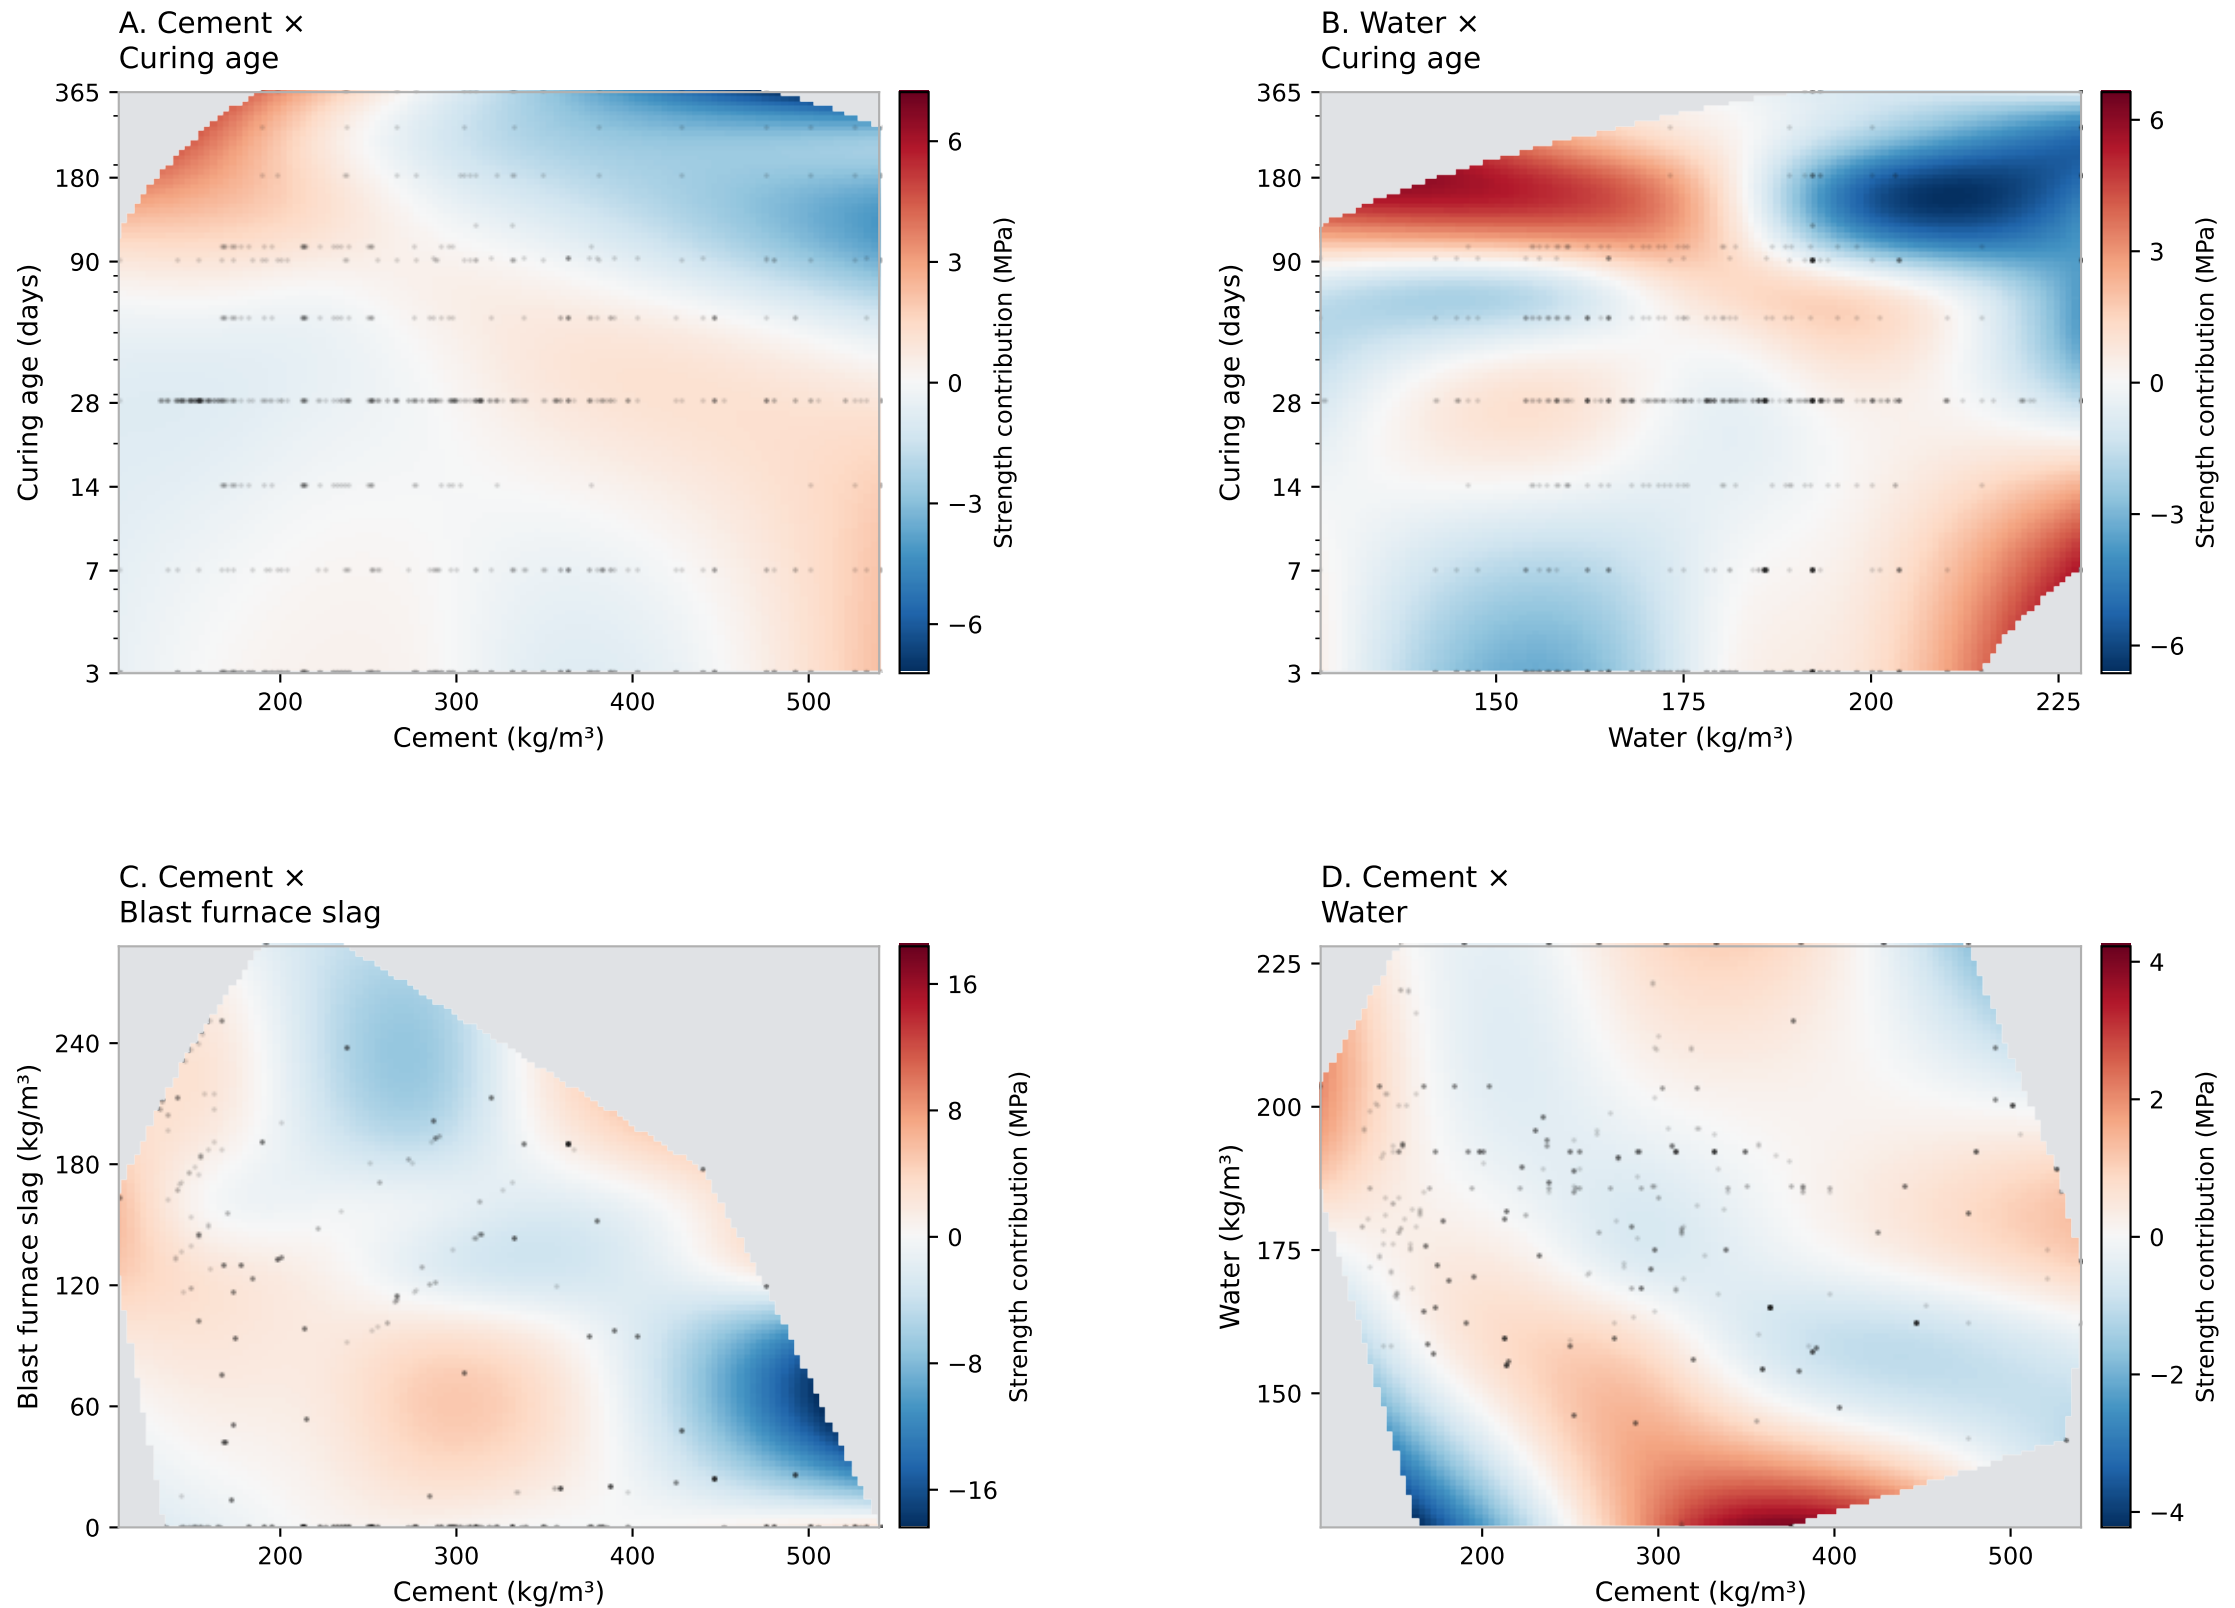

Red adds to the fitted prediction; blue subtracts. Colour scales differ by panel. Dots are training observations.

Axes show the central 98% of each predictor. Grey is outside the observed pair convex hull, not an uncertainty band.

Concrete: fitted interaction contributions

Selected 4-pair model: 16.7% lower test MSE than its additive control

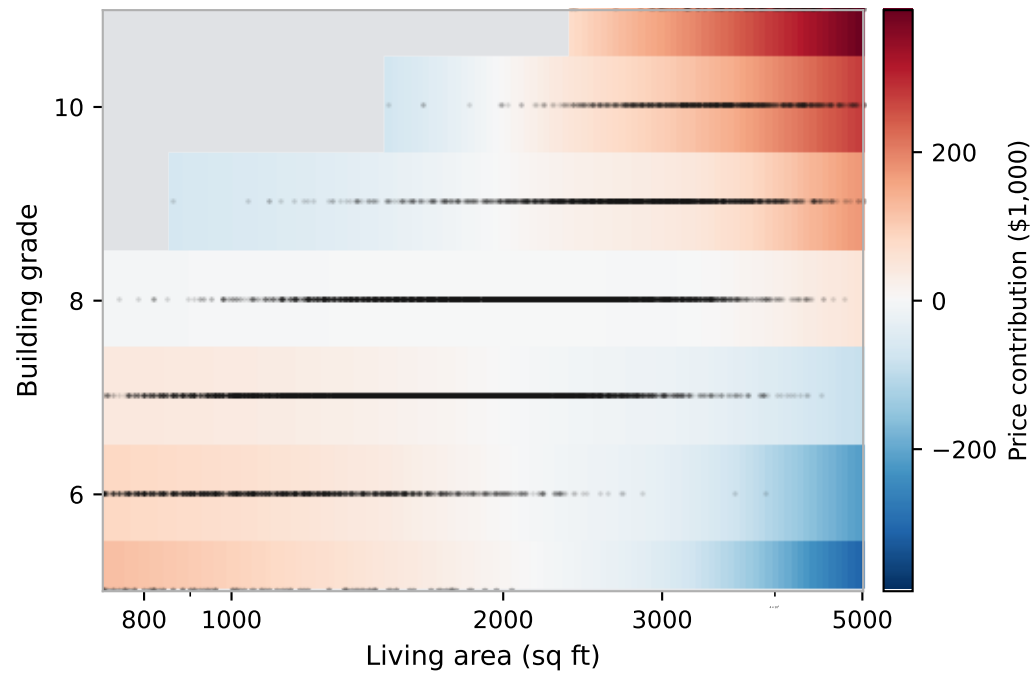

Red adds to the fitted prediction; blue subtracts. Colour scales differ by panel. Dots are training observations.

Axes show the central 98% of each predictor. Grey is outside the observed pair convex hull, not an uncertainty band.

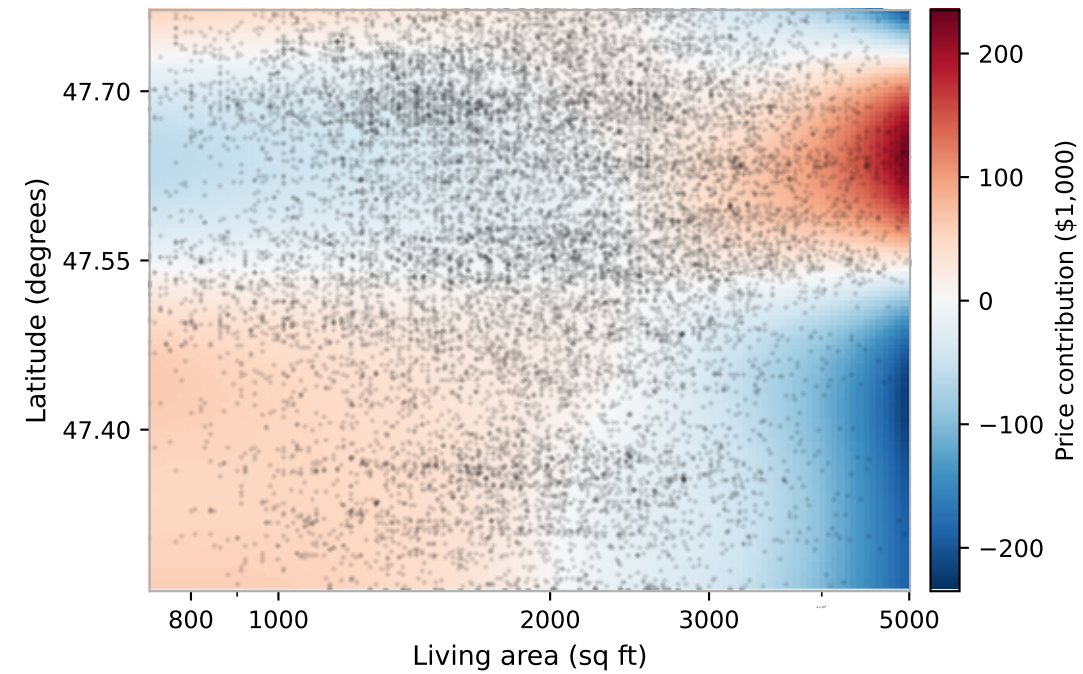

King County housing: fitted interaction contributions

Selected 4-pair model: 17.3% lower test MSE than its additive control

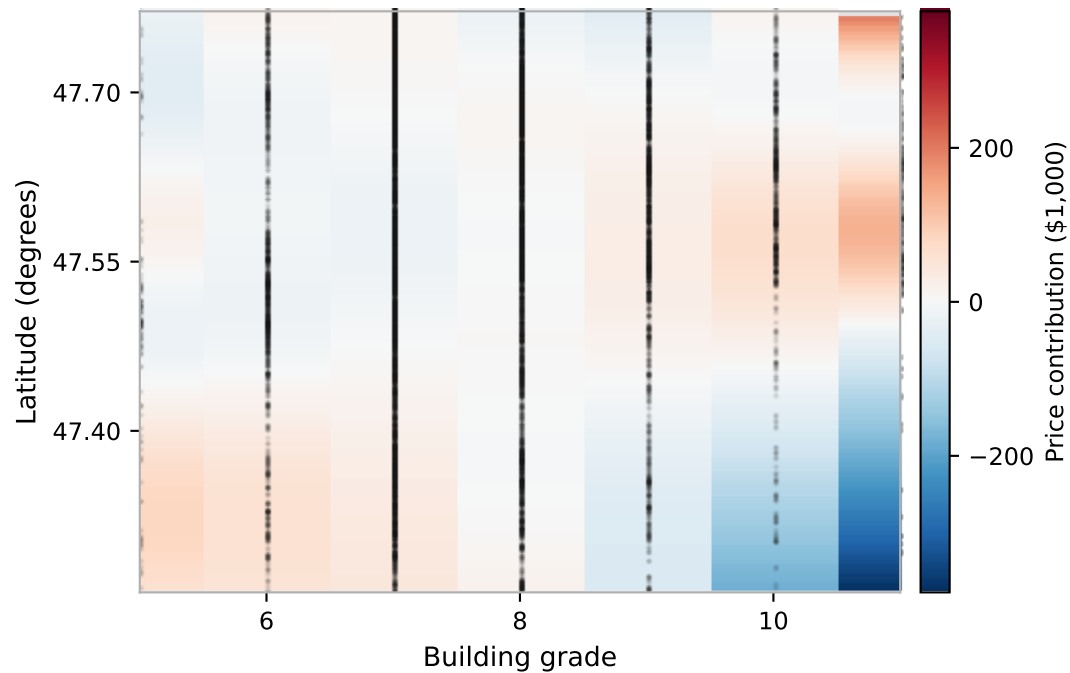

A. Living area $\times$ Building grade

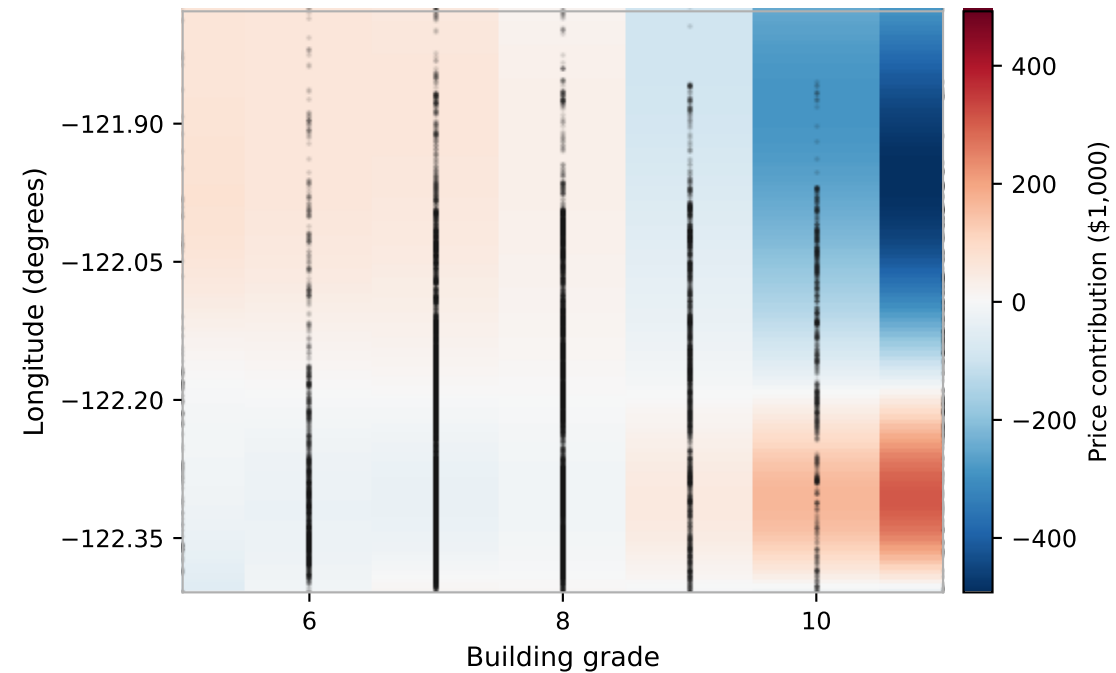

B. Living area $\times$ Latitude

C. Building grade $\times$ Latitude

D. Building grade $\times$ Longitude

Red adds to the fitted prediction; blue subtracts. Colour scales differ by panel. Dots are training observations.

Axes show the central 98% of each predictor. Grey is outside the observed pair convex hull, not an uncertainty band.
